

doc-7_product-team-update-design-systems

This quarter, the product engineering team successfully rolled out our internal design system, “Orion,” across all active web properties. The new system improves developer efficiency and ensures a consistent user experience across product lines.

Leveraging our new component libraries, we saw a 31% increase in frontend deployment velocity and a 22% reduction in UI bugs reported during QA.

While not directly related to financial products, the initiative underscores our commitment to scalable engineering practices and faster feature delivery. Orion will serve as the foundation for future cross-platform initiatives, including mobile and tablet UIs.

This project also laid the groundwork for the upcoming “Apollo” initiative focused on design-to-code automation.
